

1. (Amended) A method of fabricating a liquid crystal display panel having first and ~~second~~ substrates, the method comprising the steps of:
- forming a first and second orientation films on the first and second substrates, respectively;
 - forming a seal material at edges of the first substrate;
 - assembling the first and second substrates with each other;
 - performing a first pressurizing and heating process on the first and second substrates to form a first cell gap;
 - injecting a liquid crystal material into the first cell gap;
 - performing second pressurizing and heating process on the first and second substrates to form a second cell gap, wherein the second heating process is sufficient to soften the seal material and the second cell gap is narrower than the first cell gap; and
 - sealing the second cell gap.

7. (Amended) A method of fabricating a liquid crystal display panel having first and second substrates, the method comprising the steps of:
- assembling the first substrate with the second substrate;
 - performing a first pressurizing and heating process on the assembled substrates to have a first cell gap;
 - injecting a liquid crystal material into the first cell gap;

performing second pressurizing and heating process on the substrates to have a second cell gap, wherein the second heating process is sufficient to soften the seal material and the second cell gap is narrower than the first cell gap;
sealing the second cell gap; and
cutting the sealed panel into a unit cell.
